INTISARI

Latar Belakang: Upaya pemerintah untuk menekan laju pertumbuhan penduduk dengan pengendalian fertilitas melalui program KB, hasil Survei Demografi Kesehatan Indonesia tahun 2015 *unmet need* KB di Indonesia masih cukup tinggi yaitu 14,4% sehingga pencapaiannya 73,6% dimana angka ini mengalami peningkatan dari tahun-tahun sebelumnya. Presentase *unmet need* pada wanita berstatus menikah umur 15-49 tahun di Indonesia adalah 14,4%, 7,9 % untuk pembatasan kelahiran dan 6,5% untuk penundaan kelahiran.

Tujuan Penelitian: Mengetahui hubungan dukungan suami dengan pemenuhan kebutuhan KB pada pasangan usia subur (PUS) di Dusun Metes Desa Argorejo Kecamatan Sedayu Bantul

Metode Penelitian: Metode penelitian ini adalah dengan rancangan *cross sectional*. Metode analisis data dengan menggunakan *chi square*. Populasi sebanyak 181 orang pasangan usia subur dan 158 orang *unmet need*. Sampel dalam penelitian ini sebanyak 123 *meet need* dan 112 orang *unmet need* yang diambil dengan teknik *quota sampling*.

Hasil Penelitian: Berdasarkan hasil uji korelasi *chi-square* diperoleh nilai signifikansi (probabilitas) 0,00. Probabilitas kurang dari 0,05 ($0,000 < 0,05$). Simpulan bahwa ada Hubungan antara dukungan suami dan pemenuhan kebutuhan program KB pada PUS yang berada di Dusun Metes Kecamatan Sedayu Bantul Desa Argorejo.

Kesimpulan: Hasil penelitian ini menunjukkan, mayoritas responden mengalami *unmet need* disebabkan oleh semakin tinggi dukungan suami maka akan menurunkan angka *unmet need*. Lemahnya hubungan antara dukungan suami dengan pemenuhan kebutuhan KB di sebabkan oleh kurangnya dukungan emosional dari suami seperti suami membandingkan istri dengan tetangga yang mengalami efek samping KB.

Kata Kunci: Pasangan Usia Subur, pemenuhan KB, Dukungan Suami.

ABSTRACT

Background: Government afforded to curb population growth rate with fertility control through family planning program, Indonesia Demographic Health Survey result 2015 unmet need of KB (Family Planning) in Indonesia was still high enough that was 14,4% so its achievement was 73,6% where this number increased each year before. The unmet needed percentage of married women aged 15-49 years in Indonesia is 14.4%, 7.9% for birth control and 6.5% for the birth delay.

Objective: The research aimed to know the relationship of husband support with the fulfillment of family planning needed in fertility age couple (FAC) in Metes Argorejo Village, Sedayu sub-district, Bantul.

Research Method: This research method was with the cross-sectional design. Data analysis method used chi-square. The population of 181 couples of childbearing age and 158 unmet need. The samples in this study were 123 meet need and 112 unmet need were taken with quota sampling technique.

Results: Based on the results of the chi-square correlation test obtained value significance (probability) 0.00. Probability was less than 0.05 ($0.000 < 0.05$). The conclusion that there was a relationship between husband support and fulfillment needs of family planning program in FAC located in Metes Sedayu sub-district Bantul Argorejo Village.

Conclusion: The results of this study showed that the majority of respondents experiencing unmet need was caused by the higher support of husbands will lower the rate of unmet need. A weak relationship between the supports of husbands with the fulfillment of family planning needs to be caused by lack of emotional support from husbands such as husbands compare wives with neighbors who experience KB side effects.

Keywords: Fertility Age Couple, KB (Family Planning) fulfillment, Husband Support.
